

## SPX1585

### 5A Low Dropout Voltage Regulator Adjustable & Fixed Output, Fast Response

#### FEATURES

- Adjustable Output Down To 1.2V
- Fixed Output Voltages 1.5V, 2.5V, 3.3V
- Output Current Of 5A
- Low Dropout Voltage 1.1V Typ @ 5A.
- Extremely Tight Load And Line Regulation
- Current & Thermal Limiting
- Standard 3-Terminal Low Cost TO-220 & TO-263
- Similar To Industry Standard LT1085/LT1585

#### APPLICATIONS

- Powering VGA & Sound Card
- Power PC™ Supplies
- SMPS Post-Regulator
- High Efficiency “Green” Computer Systems
- High Efficiency Linear Power Supplies
- Portable Instrumentation
- Constant Current Regulators
- Adjustable Power Supplies
- Battery charger

#### PRODUCT DESCRIPTION

The SPX1585 are low power 5A adjustable and fixed voltage regulators that are very easy to use. It requires only 2 external resistors to set the output voltage for adjustable version. The SPX1585 are designed for low voltage applications that offer lower dropout voltage and faster transient response. This device is an excellent choice for use in powering low voltage microprocessor that require a lower dropout, faster transient response to regulate from +2.5V to 3.8V supplies and as a post regulator for switching supplies applications. The SPX1585 features low dropout of a maximum 1.2 volts.

The SPX1585 offers full protection against over-current faults, reversed input polarity, reversed load insertion, and positive and negative transient voltage. On-Chip trimming adjusts the reference voltage to 1%. The  $I_Q$  of this device flows into the load, which increases efficiency.

The SPX1585 are offered in a 3-pin TO-220 and TO-263 package compatible with other 3 terminal regulators. For a 8A low dropout regulator refer to the SPX1584 data sheet.

#### PIN CONNECTIONS

## APPLICATION HINTS

The SPX1585 incorporates protection against over-current faults, reversed load insertion, over temperature operation, and positive and negative transient voltage. However, the use of an output capacitor is required in order to insure the stability and the performances.

### Stability

The output capacitor is part of the regulator's frequency compensation system. Either a 22 $\mu$ F aluminum electrolytic capacitor or a 10 $\mu$ F solid tantalum capacitor between the output terminal and ground guarantees stable operation for all operating conditions.

However, in order to minimize overshoot and undershoot, and therefore optimize the design, please refer to the section 'Ripple Rejection'.

### Ripple Rejection

Ripple rejection can be improved by adding a capacitor between the ADJ pin and ground. When ADJ pin bypassing is used, the value of the output capacitor required increases to its maximum (220 $\mu$ F for an aluminum electrolytic capacitor, or 47 $\mu$ F for a solid tantalum capacitor). If the ADJ pin is not bypass, the value of the output capacitor can be lowered to 10 $\mu$ F for an electrolytic aluminum capacitor or 4.7 $\mu$ F for a solid tantalum capacitor.

However the value of the ADJ-bypass capacitor should be chosen with respect to the following equation:

$$C = 1 / ( 6.28 * F_R * R_1 )$$

Where C = value of the capacitor in Farads (select an equal or larger standard value),

$F_R$  = ripple frequency in Hz,

$R_1$  = value of resistor  $R_1$  in Ohms.

If an ADJ-bypass capacitor is use, the amplitude of the output ripple will be independent of the output voltage. If an ADJ-bypass capacitor is not used, the output ripple will be proportional to the ratio of the output voltage to the reference voltage:

$$M = V_{OUT} / V_{REF}$$

Where M = multiplier for the ripple seen when the ADJ pin is optimally bypassed.

$V_{REF}$  = Reference Voltage

### Reducing parasitic resistance and inductance

One solution to minimize parasitic resistance and inductance is to connect in parallel capacitors. This arrangement will improve the transient response of the power supply if your system requires rapidly changing current load condition.

### Thermal Consideration

Although the SPX1585 offers some limiting circuitry for overload conditions, it is necessary not to exceed the maximum junction temperature, and therefore to be careful about thermal resistance. The heat flow will follow the lowest resistance path, which is the Junction-to-case thermal resistance. In order to insure the best thermal flow of the component, a proper mounting is required. Note that the case of the device is electrically connected to the output. In case the case has to be electrically isolated, a thermally conductive spacer can be used. However do not forget to consider its contribution to thermal resistance.

Assuming:

$$V_{IN} = 10V, V_{OUT} = 5V, I_{OUT} = 1.5A, T_A = 50^{\circ}C/W,$$

$$\theta_{Heatsink Case} = 6^{\circ}C/W, \theta_{Heatsink Case} = 0.5^{\circ}C/W, \theta_{JC} = 3^{\circ}C/W$$

Power dissipation under this condition

$$P_D = (V_{IN} - V_{OUT}) * I_{OUT} = 7.5W$$

Junction Temperature

$$T_J = T_A + P_D * (\theta_{Case-HS} + \theta_{HS} \theta_{JC})$$

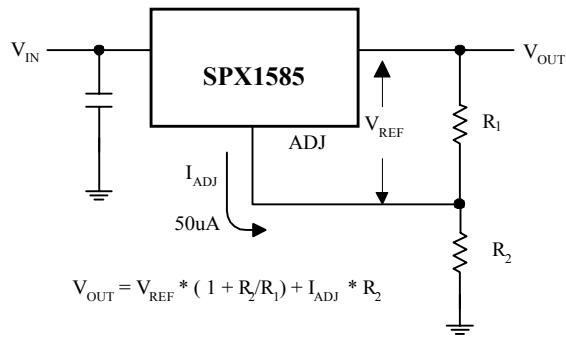

For the Control Section

$$T_J = 50 + 7.5*(0.5 + 6=3) = 121.25^{\circ}C$$

121.25 $^{\circ}$ C <  $T_{J(max)}$  for the Control & Power Sections.

In both case reliable operation is insured by adequate junction temperature.

## Basic Adjustable Regulator

$$V_{OUT} = V_{REF} * (1 + R_2/R_1) + I_{ADJ} * R_2$$

**Fig.2 Basic Adjustable Regulator**

## Output Voltage

Consider Figure 2. The resistance  $R_1$  generates a constant current flow, normally the specified load current of 10mA. This current will go through the resistance  $R_2$  to set the overall output voltage. The current  $I_{ADJ}$  is very small and constant. Therefore its contribution to the overall output voltage is very small and can generally be ignored

**Fig.3 Basic Adjustable Regulator**

## Load Regulation

Parasitic line resistance can degrade load regulation. In order not to affect the behavior of the regulator, it is best to connect directly the  $R_1$  resistance from the resistor divider to the case,

and not to the load. For the same reason, it is best to connect the resistor  $R_2$  to the Negative side of the load.

**Basic Fixed Regulator**

## Output Voltage

The fixed voltage LDO voltage regulators are simple to use regulators since the  $V_{OUT}$  is preset to the specifications. It is important however, to provide the proper output capacitance for stability and improvement. For most operating conditions a capacitance of 22uF tantalum or 100uF electrolytic will ensure stability and prevent oscillation.

## TYPICAL APPLICATIONS

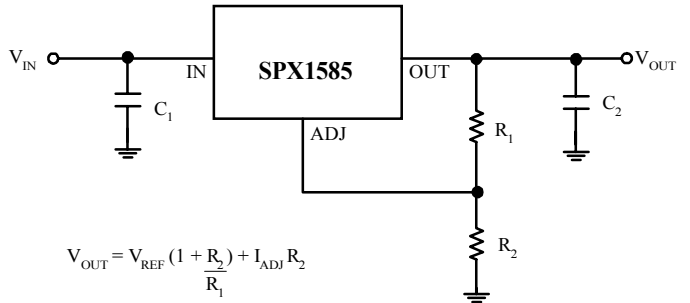

Fig. 4 5A Current output Regulator

$$V_{OUT} = V_{REF} \left(1 + \frac{R_2}{R_1}\right) + I_{ADJ} R_2$$
