

# Smart Four Channel Highside Power Switch

## Features

- Overload protection
- Current limitation
- Short-circuit protection
- Thermal shutdown
- Overvoltage protection (including load dump)
- Fast demagnetization of inductive loads
- Reverse battery protection<sup>1)</sup>
- Undervoltage and overvoltage shutdown

with auto-restart and hysteresis

- Open drain diagnostic output
- Open load detection in OFF-state
- CMOS compatible input
- Loss of ground and loss of  $V_{bb}$  protection
- **Electrostatic discharge (ESD)** protection

## Application

- $\mu$ C compatible power switch with diagnostic feedback for 12 V and 24 V DC grounded loads
- All types of resistive, inductive and capacitive loads
- Replaces electromechanical relays and discrete circuits

## General Description

N channel vertical power FET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS® technology. Providing embedded protective functions.

9) Add  $I_{ST}$ , if  $I_{ST} > 0$

10) Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

11) If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest  $V_{ON(CL)}$

12) Requires a  $150\ \Omega$  resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 3 and circuit page 9).

Parallel switching of channel 1 and 2 (also channel 3 and 4) is easily possible by connecting the inputs and outputs in parallel (see truth table). If switching channel 1 to 4 in parallel, the status outputs ST1/2 and ST3/4 have to be configured as a 'Wired OR' function with a single pull-up resistor.

<sup>14</sup>) With additional external pull up resistor

<sup>15</sup>) An external short of output to V<sub>bb</sub> in the off state causes an internal current from output to ground. If R<sub>GND</sub> is used, an offset voltage at the GND and ST pins will occur and the V<sub>ST low</sub> signal may be errorious.

<sup>16</sup>) Low resistance to V<sub>bb</sub> may be detected by no-load-detection

Terms

Leadframe ( $V_{bb}$ ) is connected to pin 1,10,11,12,15,16,19,20  
 External  $R_{GND}$  optional; two resistors  $R_{GND1/2}$ ,  $R_{GND3/4} = 150 \Omega$  or a single resistor  $R_{GND} = 75 \Omega$  for reverse battery protection up to the max. operating voltage

**Input circuit (ESD protection), IN1...4**

ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

**Status output, ST1/2 or ST3/4**

ESD-Zener diode: 6.1 V typ., max 5.0 mA;  $R_{ST(ON)} < 380 \Omega$  at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

**Inductive and overvoltage output clamp, OUT1...4**

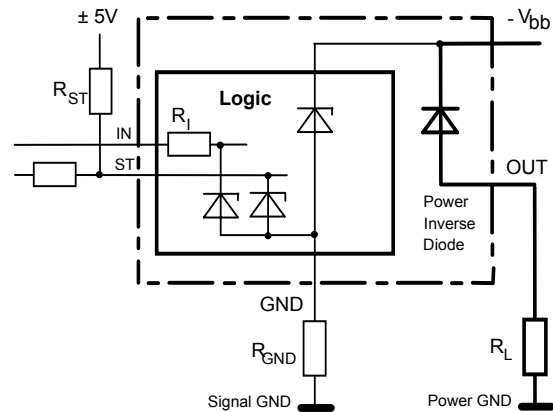

$V_{ON}$  clamped to  $V_{ON(CL)} = 47 \text{ V typ.}$

**Overvoltage protection of logic part**

GND1/2 or GND3/4

$V_{Z1} = 6.1 \text{ V typ.}$ ,  $V_{Z2} = 47 \text{ V typ.}$ ,  $R_I = 3.5 \text{ k}\Omega \text{ typ.}$ ,  $R_{GND} = 150 \Omega$

**Reverse battery protection**

$R_{GND} = 150 \Omega$ ,  $R_I = 3.5 \text{ k}\Omega \text{ typ.}$

Temperature protection is not active during inverse current operation.

**Open-load detection, OUT1...4**

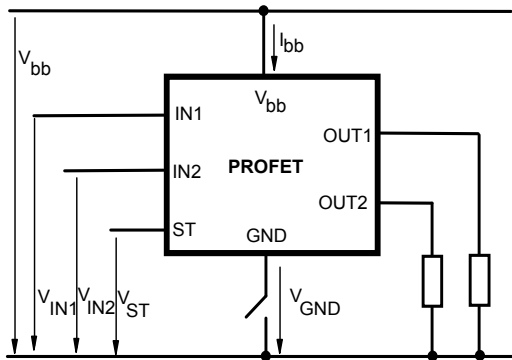

OFF-state diagnostic condition:

$V_{OUT} > 3 \text{ V typ.}$ ; IN low

**GND disconnect**

(channel 1/2 or 3/4)

Any kind of load. In case of IN=high is  $V_{OUT} \approx V_{IN} - V_{IN}(T+)$ . Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low}$  signal available.

**GND disconnect with GND pull up**

(channel 1/2 or 3/4)

Any kind of load. If  $V_{GND} > V_{IN} - V_{IN}(T+)$  device stays off. Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low}$  signal available.

**V<sub>bb</sub> disconnect with energized inductive load**

For an inductive load current up to the limit defined by  $E_{AS}$  (max. ratings see page 3 and diagram on page 10) each switch is protected against loss of  $V_{bb}$ .

Consider at your PCB layout that in the case of  $V_{bb}$  disconnection with energized inductive load the whole load current flows through the GND connection.

**Inductive load switch-off energy dissipation**

Energy stored in load inductance:

$$E_L = 1/2 \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for  $R_L > 0 \Omega$ :

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left( 1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

**Maximum allowable load inductance for a single switch off (one channel)<sup>5)</sup>**

$L = f(I_L)$ ;  $T_{j,start} = 150^\circ\text{C}$ ,  $V_{bb} = 12\text{V}$ ,  $R_L = 0 \Omega$

**Typ. on-state resistance**
 $R_{ON} = f(V_{bb}, T_j); I_L = 1.8 \text{ A}, I_N = \text{high}$ 

**Typ. ground pin operating current**
 $I_{GND} = f(V_{bb}, T_j); V_{IN} = \text{high (one channel on)}$ 

**Typ. standby current**
 $I_{bb(off)} = f(T_j); V_{bb} = 9...34 \text{ V}, I_{N1...4} = \text{low}$ 

$I_{bb(off)}$  includes four times the current  $I_{L(off)}$  of the open load detection current sources.

**Typ. initial short circuit shutdown time**
 $t_{off(SC)} = f(T_{j,start}); V_{bb} = 12 \text{ V}$ 

## Timing diagrams

Timing diagrams are shown for chip 1 (channel 1/2). For chip 2 (channel 3/4) the diagrams are valid too. The channels 1 and 2, respectively 3 and 4, are symmetric and consequently the diagrams are valid for each channel as well as for permuted channels
